Welcome to the 2007 Iowa Health Fact Book!

This book is the sixth in a series of Iowa Health Fact Book biennial publications and has been produced as a collaborative effort between The University of Iowa College of Public Health and the Iowa Department of Public Health. Designed to be a broad-ranging report, the Iowa Health Fact Book summarizes many health and health related behaviors of Iowans. Much of this information is presented for each of Iowa's 99 counties and includes such knowledge as data on disease incidence and mortality, health and social behaviors, health resources, and environmental factors. With this book, we present a tool that is useful to Iowa's health care providers, health policy-makers, public health practitioners, and health researchers alike.

The Iowa Health Fact Books in 1997, 1999, 2001, 2003, and 2005 were distributed to registrants at the Governor's Conference on Public Health (Barn Raisings I, II, III, IV, and V) in either print or CD-ROM format. This year, all participants of the Barn Raising VI, to be held in August 2007, will again receive the CD-ROM version free. A limited number of printed copies of the 2007 edition will be available for those who prefer a bound book. This edition, along with previous editions, is posted on our college website. Note that the pages of the book can be printed from the CD-ROM files or from PDF files on our website.

The format of the 2007 Fact Book follows closely to that of the past editions, allowing users the ability to track changes over time. As we continue this effort over the years, we are in a better position to track changes longitudinally. Like the previous editions, we present the data in a descriptive format, without analysis and interpretation of trends. The interested reader is free to use these data in his/her own analyses, and is encouraged to do so with care and attention paid to analytic issues such as small counts and possible changes in the way the data are collected. The data source is given for each type of information presented, and those responsible for collecting the data can address any questions you may have. You will also find a list of other health information resources and their contact information in the Appendix.

We are pleased to make this rich source of health information available to the public and hope that you find it useful.

Sincerely,

*James A. Merchant, M.D., Dr. P.H.
Dean, College of Public Health*

Introduction

In the 2007 Iowa Health Fact Book, state-wide data relating to health outcomes, social and health behaviors, and health care resources are presented, generally at the county level. The data have been compiled in this book, but were collected using different methodologies by various organizations and reporting mechanisms. We encourage readers who would like to use these data to learn about the data collection processes and data definitions from those responsible for collecting the information. The use of U.S. Census data to compute adjusted rates, sparse data concerns, data groupings, data definitions, and use of ranks are described in the Fact Book Conventions section of this Introduction.

The second section, Healthy Iowans 2010 Leading Indicators, outlines the major public health mortality concerns in Iowa and provides both baseline values and target values. Current levels have been included to show the progress toward those goals. Demographics are provided in the third section, listing county-specific population estimates in Iowa for the years 1997 – 2006. These population totals drive the calculation of crude and age-adjusted rates in later sections.

The remaining ten sections provide valuable information on a variety of aspects of the health of Iowans. The Health and Social Behaviors section tracks behaviors affecting our health, including the 2006 Iowa Adult Tobacco Survey. The Prenatal and Infant Health section covers information regarding infants, but also the well-being of their mothers during pregnancy. The Infectious Diseases section focuses mainly on sexually transmitted diseases, although other infectious disease data are presented as well. The Cancer Incidence and Mortality section provides both crude and age-adjusted rates for selected major types of cancer. The Injury Mortality section reveals both crude and age-adjusted rates for certain causes of mortality, such as motor vehicle deaths and deaths caused by firearms. Closely related is the Youth Injury Mortality section, providing the same type of data but restricted to individuals aged less than 20. The last mortality section, Other Mortality, lays out crude and age-adjusted rates for mortality not caused by cancer or the causes listed in the previous two sections. A component of a good health care system is adequate capacity of both facilities and health care providers. The Health Care Providers chapter shows counts and crude rates of various types of providers across the state. The Health Care Facilities chapter details counts and crude rates for a variety of types of facilities. The final section of the book, entitled Environmental Health Indicators, focuses exclusively on the testing of blood lead poisoning of children in Iowa.

Fact Book Conventions

Layout

The time interval covered differs across the data items, mainly due to differences in data availability. Where reasonable and possible, county-specific data are presented. When it is not presented in that format, it is either because the data were too sparse (that is, a relatively small number of counties with non-zero counts) or they were not available at the county level. Since many of the data items presented would be expected to vary with county population size, the counties have been organized into groups based on their county population size. Both crude and age-adjusted population rates are presented when reasonable, which also facilitates comparisons across counties. For data items in which historical counts earlier than those presented in this book are available, line graphs showing time trends by county grouping are presented as well.

Four County Groupings

An MSA (Metropolitan Statistical Area) county is defined by the U. S. Census Bureau as a central city along with the counties economically and socially connected to it. Each MSA must have one city with at least 50,000 inhabitants or a Census-defined urbanized area with a total metropolitan population of at least 100,000 (75,000 in New England). Under the year 2000 standards, rural counties may be included in an MSA if at least 25 percent of the workers who live in the county work within the central county or counties (that is, the county or counties containing the urban core of 50,000 or more population) of the MSA. A county can also be included if at least 25 percent of the jobs in the county are filled by workers living in the central counties of the MSA. This definition was updated following the 2000 Census resulting in many newly classified MSA counties.

There were twenty counties defined by the U. S. Census Bureau as MSA from the 2000 Census. For the seventy-nine other counties, using the 1997-2006 average county population, there were 20 counties with less than 10,000 residents, 38 counties with 10,000 to 20,000 residents and 21 counties with 20,000 to 50,000 residents. See the map on the following page to identify the counties in each group.

County Group Based on 1997-2006 Average Population

**Small Numbers**

If the number of county-specific events in a health outcome table was less than five, we masked the count by replacing it with an asterisk (*) to protect subject confidentiality. However, all numbers are included in the computations needed for the line graphs and other charts accompanying the health outcomes tables, which summarizes data over a larger number of people. If only one value in a county grouping is masked with an (*), then we do not report the grouping total, only a range of possible values.

Population Standard

The Year 2000 Estimated United States Standard Million Population from the United States Census Bureau has been used for adjustment purposes.

Adjustment Calculations

Both crude and age-adjusted rates have been calculated and presented in many of the data tables. Crude rates for an entity (e.g., county) are the number of events of a health outcome divided by the population at risk in the county. The age-adjusted rates used in this book are a weighted average of the age-specific rates from the targeted population (e.g., county), where the weights are the proportions of persons in the corresponding age groups of a standard population. As stated above, the Year 2000 United States population was used as the standard population. If data only represent one age group then the age-adjusted rate is identical to the crude rate and thus not reported (e.g., Live Births).

There are no hard and fast rules as to when one should use either the crude or the adjusted rate for comparisons. A few guidelines can, however, be noted. A crude rate for a county reflects the disease or mortality burden for a county and may be useful to the health policy makers in the county. If a county has a relatively high proportion of elderly and the disease is associated with older individuals, crude rates will reflect that higher burden due to greater numbers of elderly. The age-adjusted rate is also useful as a county comparison index, but after putting both counties on the same playing field with respect to the age distribution in each. These rates have been adjusted to the same standard population, so the effect of differing age distributions in two counties is eliminated before the comparison is made. Hence, both are useful descriptive indices of diseases, but with differences in interpretation.

Ranks

The county rank represents the ranking of the county among the 99 counties of Iowa, with a rank of “1” given to the county with the largest rate and “99” to the county with the smallest rate. In general, ranks were presented for a data table when no counts in the table were less than five; i.e. when there were no very small numbers.

Maps

State maps were created to present the data for Health Care Providers and Health Care Facilities instead of tables. The number in the county represents the 2007 count. The crude rates were calculated from the estimated 2006 county population. These rates were grouped into four categories of approximately twenty-five counties each and shaded on the map. If a county rate fell on the border between two categories, it was shaded using the smaller region.

Healthy Iowans 2010 Leading Indicators

Healthy Iowans 2010, Iowa's master plan for health, drew on the expertise and experience of hundreds of Iowans who reviewed data from many sources before setting goals and action steps. Published in January 2000, *Healthy Iowans 2010* is a companion to *Healthy People 2010*, the federal plan aimed at preventing disease and promoting health. Both plans drive funding.

In July 2005, a midcourse revision was published and was a product of about 425 people from public, private, and non-profit entities. There are 25 chapters, a team for each chapter, 217 goals, and more than 430 action steps. To reach the goals, teams crafted specific action steps to be taken with a time line for each step and an organization responsible for the action. Each year, the organizations that agreed to take action that year are asked to report progress. A tracking system, an integral part of implementation, assures accountability.

New to the updated plan are chapters on vision and on emergency preparedness and response, a glossary of acronyms, and goal cross references at the end of each chapter. Each chapter is introduced with a progress report on what *Healthy Iowans 2010* steps have been taken and goals achieved during the first part of the decade. Special attention in each chapter is paid to the Olmstead decision, a US Supreme Court decision requiring (1) Government services to be delivered in a way that avoids discrimination against people with disabilities and (2) States to administer programs, services, and activities in the most integrated setting appropriate to the needs of qualified people with disabilities.

What continues is the idea that when stakeholders decide on disease prevention and health promotion strategies and agree to work together on them, all Iowans benefit. In making those decisions, the teams analyzed relevant data. A database has been published on the Iowa Department of Public Health Web site: www.idph.state.ia.us.

The following pages contain many of the goals based on mortality data analysis. We report the baseline value as stated in the midcourse revision, the most current level of the indicator, and the 2010 target level. For 13 of the 16 goals, the most current levels indicate progress is being made toward reaching the 2010 target level. For motor vehicle fatalities, the 2010 goal has already been surpassed given the current level rate.

Healthy Iowans 2010 Mortality Goals

Mortality Goals (Chapter-Section)	Goal Statement	Baseline rate ¹ (year)	Current rate ¹ (year)	Midcourse Revision 2010 Goal ¹
Cancer				
Lung cancer (2-4)	Reduce lung cancer deaths to a rate of no more than 46.0 per 100,000	54.1 (1994-1996)	52.3 (2002-2004)	46.0
Breast cancer (2-5)	Reduce female breast cancer deaths to a rate of no more than 19.0 per 100,000 females	29.0 (1994-1996)	23.3 (2002-2004)	19.0
Cervical cancer (2-6)	Reduce cervical cancer deaths to a rate of no more than 1.9 per 100,000 females	2.6 (1994-1996)	2.4 (2002-2004)	1.9
Colorectal cancer (2-7)	Reduce colorectal cancer deaths to a rate of no more than 15.5 per 100,000	23.2 (1994-1996)	19.4 (2002-2004)	15.5
Oral cavity cancer (2-8)	Reduce oral cavity and pharyngeal cancer deaths to a rate of no more than 1.8 per 100,000	2.6 (1994-1996)	2.4 (2002-2004)	1.8
Prostate cancer (2-9)	Reduce prostate cancer deaths to a rate of no more than 26.0 per 100,000	36.0 (1994-1996)	27.7 (2002-2004)	26.0
Skin melanoma (2-10)	Reduce skin melanoma (<u>malignant cancer</u>) deaths to a rate of no more than 1.9 per 100,000	2.5 (1994-1996)	2.3 (2002-2004)	1.9

Healthy Iowans 2010 Mortality Goals (continued)

Mortality Goals (Chapter-Section)	Goal Statement	Baseline rate (year)	Current rate (year)	Midcourse Revision 2010 Goal
<u>Diabetes</u> Diabetes (3-4)	Decrease death and disability with diabetes as the primary cause to 16.0 per 100,000 people in 2010 (480 per year)	24.8 ¹ (2002)	24.3 ¹ (2005)	16.0 ¹
<u>Heart Disease and Stroke</u> Coronary heart disease (9-1)	Reduce by 13% heart disease deaths among all Iowans	266 ¹ (2003)	250.4 ¹ (2005)	232.0 ¹
Stroke (9-2)	Reduce by 16% stroke deaths among all Iowans	70.4 ¹ (2003)	64.0 ¹ (2005)	59.0 ¹
<u>Maternal, Infant, and Child Health</u> Infant (11-1)	Reduce the overall infant mortality rate to no more than 5 per 1,000 live births	6.0 ² (1998)	5.3 ² (2005)	5.0 ²
Perinatal mortality (11-8)	Reduce the overall perinatal mortality rate to no more than 7.1 per 1,000 live births plus fetal deaths	8.4 ² (2002)	8.7 ² (2005)	7.1 ²
<u>Unintentional Injuries</u> Falls (22-2)	Reduce deaths from falls and fall-related injuries to no more than 2.3 per 100,000 people	11.5 ¹ (1997)	10.6 ¹ (2005)	2.3 ¹
<u>Unintentional Injuries</u> Poisoning (22-8)	Reduce deaths in Iowa caused by unintentional poisoning to 1.0 per 100,000 people (30 per year).	1.9 ¹ (2001)	3.5 ¹ (2005)	1.0 ¹
Fire (22-9)	Reduce Iowa's fire death rate to less than one per 100,000 people	1.7 ¹ (1990-1999)	1.1 ¹ (2005)	< 1.0 ¹
Motor vehicle crashes (22-10)	Reduce deaths by motor vehicle crashes to no more than 5.6 per 100,000 people in children aged 14 and younger	6.3 ¹ (1994)	4.3 ¹ (2005)	5.6 ¹

Demographics

Many of the health indicators in the 2007 Iowa Health Fact Book are presented with rates calculated using the population of the county and state. These rates are also stratified into population subgroups based on a 10-year average of each county's population. This not only contrasts the rural and urban aspects of the state but also includes trends in age and ethnic distribution of the population. The Year 2000 U.S. standard population age distribution is used for calculating age-adjusted rates. Population estimates have been obtained from the U.S. Census and from the State Health Registry of Iowa via the National Cancer Institute's SEER*Stat software program. Estimates are used for individual years and for year groupings where appropriate.

KEY FEATURES IN IOWA DEMOGRAPHICS...

- ✓ Increasing urbanization
- ✓ Females represent 50.8% of population
- ✓ Median age 38.6 years
- ✓ Over 65 represents 14% of population

The population in Iowa is becoming increasingly urbanized. Using the 2000 Census, twenty counties were defined as Metropolitan Statistical Areas (MSA) doubling the previous number of ten MSA defined counties. The Metropolitan Statistical Areas are Ames (Story County), Cedar Rapids (Benton, Jones, Linn Counties), Des Moines (Dallas, Guthrie, Madison, Polk, Warren Counties), Dubuque (Dubuque County), Iowa City (Johnson, Washington Counties), Omaha-Council Bluffs (Harrison, Mills, Pottawattamie Counties), Sioux City (Woodbury County), Waterloo-Cedar Falls (Black Hawk, Bremer, Grundy Counties). Over 55% of the 2006 estimated Iowa population of 2,982,085 lived in MSA counties. The population of Iowa is expected to exceed 3 million by 2010.

CHARACTERISTICS OF RACE / ETHNICITY

White	93.5%
Black or African American	2.2%
Asian	1.5%
Some other race or races	2.8%
Hispanic or Latino (of any race)	3.7%

The distribution of the population by age is different among the county groupings. The larger counties have a greater percentage of their population as young adults (15-44 years) compared to the

smaller counties. Conversely, the smaller counties have a larger percentage of persons 65 years of age or older. These differences in age distributions are standardized through age-adjustment so risk factors other than age can be compared. As shown, the population of the state has become older since 1970. The percent of Iowans age 65 and older increased steadily through the early 1990's, but has slightly decreased since then.

Health and Social Behaviors

The health of individuals and their communities is determined by a variety of factors including biologic, environmental, social, and behavioral influences. This section provides an overview of selected surveys and statistics collected in Iowa to track the effects of these various influences on the health of Iowans. Introductions are provided individually for each of the surveys with links to more detailed information on survey methodology and additional data where available. Information on marriages and dissolutions is included at the end of this section because it characterizes and contrasts the population dynamics that can affect health.

QUESTIONS TO CONSIDER WHEN USING SURVEY RESULTS...

- ✓ What was the method used to conduct the survey, i.e., telephone, mail, personal interview?
- ✓ What was the response rate of those surveyed and what factors might influence who responds and who doesn't?
- ✓ Are the survey respondents representative of and thus generalizable to a particular population?
- ✓ Because a survey provides only estimates based on the sampled population, what are the variability measures of these estimates?
- ✓ Were the survey questions cross-sectional in that they represent attitudes, behaviors, or disease status of different people, or were the same people surveyed repeatedly over time?

Behavioral Risk Factor Surveillance System (BRFSS)

The Behavioral Risk Factor Surveillance System (BRFSS) survey is an ongoing telephone survey that is conducted each year in every state, including Iowa, as well as in the District of Columbia, and in Puerto Rico. It is financially and technically supported by the Centers for Disease Control and Prevention (CDC) and is a scientifically-designed and validated method of collecting information.

The Iowa BRFSS collects health risk behavior information from over 5,000 household telephone surveys in both English and Spanish, and is designed to collect information on nationally agreed upon topics and on additional areas of special interest to Iowa. Because the BRFSS is conducted annually, the prevalence of these behaviors may be followed longitudinally. The risk behaviors of those surveyed (Iowa residents age 18 and over) are major contributions to illness, disability, and premature death.

The goal of the Iowa BRFSS is to provide data to initiate and guide health promotion disease prevention programs. The BRFSS program achieves this goal by:

1. determining state specific prevalence of personal health behaviors related to the leading cause of premature death;
2. developing the capacity of the state health department to conduct credible telephone surveys; and
3. advancing the understanding that health-related behaviors are critical indices of health.

BRFSS KEY AREAS...

- ✓ Health Status
- ✓ Health Care Coverage
- ✓ Physical Inactivity
- ✓ Body Weight
- ✓ Smoking
- ✓ Alcohol Consumption
- ✓ Hypertension
- ✓ Cholesterol Awareness
- ✓ Colorectal Cancer Screening
- ✓ Diabetes
- ✓ Adult Immunizations
- ✓ Injury Control
- ✓ Women's Health
- ✓ HIV/AIDS

The BRFSS results can help inform health professionals as to health behaviors and beliefs of the general population, and can be used as a measure of the effectiveness of various public health strategies.

Iowa Behavioral Risk Factor Surveillance System 2004-2005

	Definition	Iowa		U.S. Median ¹	
		2004 % (%,%) ²	2005 % (%,%) ²	2004 %	2005 %
Binge drinking	All respondents having five or more alcoholic beverages on one or more occasion in the past month.	19.0 (17.6, 20.4)	18.6 (17.1, 20.1)	14.9	14.4
Chronic drinking	All respondents having an average of greater than two drinks per day for men, and one drink per day for women.	5.6 (4.8, 6.4)	5.6 (4.7, 6.5)	4.9	4.9
Current smoker	All respondents smoking 100 cigarettes in their lifetime and currently smoking every day or some days.	20.8 (19.4, 22.2)	20.4 (19.0, 21.8)	20.8	20.5
Diabetes	All respondents ever being diagnosed with diabetes, excluding gestational diabetes.	6.4 (5.7, 7.1)	6.8 (6.1, 7.5)	7.1	7.3
High blood pressure	All respondents being told by a health professional that they had high blood pressure.	26.1 (24.8, 27.5)	24.5 (23.2, 25.8)	**	25.5
Cholesterol	All respondents having their cholesterol checked in the past five years.	**	72.2 (70.5, 73.9)	**	73.0
High cholesterol	All respondents being told by a health professional that they had high cholesterol.	**	35.6 (33.9, 37.3)	**	35.6
No insurance coverage	All respondents who currently did not have any kind of health care coverage.	10.6 (9.4, 11.8)	10.7 (9.5, 11.9)	14.9	14.5
Mammogram	Female respondents age 40 and older having a mammogram in the past two years.	75.2 (73.2, 77.2)	75.5 (73.5, 77.5)	74.7	**
Pap test	Female respondents with a uterine cervix having a pap test in the past three years.	86.0 (84.3, 87.7)	84.6 (82.6, 86.7)	85.9	**
Obesity	All respondents who had a calculated body mass index (BMI) of 30.0 or above.	23.5 (22.1, 24.9)	25.4 (23.9, 26.9)	23.2	24.4
Overweight	All respondents who had a calculated body mass index (BMI) from 25.0 to 29.9, inclusive.	37.4 (35.8, 39.0)	37.1 (35.5, 38.7)	36.9	36.7
Sigmoidoscopy/ Colonoscopy	Respondents age 50 and over who ever had a sigmoidoscopy or colonoscopy.	51.6 (49.4, 53.8)	55.9 (53.8, 58.0)	53.0	**
Tested for HIV	Respondents age 18 to 64 who have ever had a HIV test, excluding for blood donations.	29.0 (27.3, 30.8)	28.5 (26.7, 30.2)	41.9	38.4
Asthma	All respondents who currently have asthma.	6.6 (5.8, 7.4)	7.2 (6.3, 8.1)	8.3	8.0
Health status	All respondents who rate their current health as good, very good, or excellent.	87.6 (86.6, 88.6)	87.8 (86.7, 88.9)	84.9	85.1

**This question was not asked in all states in the given year

2006 Iowa Adult Tobacco Survey (ATS)

The 2006 Iowa Adult Tobacco Survey (ATS) is the fourth in a series of surveys (2001, 2002, and 2004) designed to measure tobacco-related behaviors and attitudes among Iowa adults. The results of the survey are used to evaluate the effectiveness of current Division of Tobacco Use Prevention and Control programs and activities to reduce tobacco use among adult Iowans. The Division contracted with the Center for Social and Behavioral Research at the University of Northern Iowa to conduct this telephone survey of a random sample of 1,950 adult Iowans. The ATS was developed by the U.S. Centers for Disease Control and Prevention and is conducted biannually in all 50 states.

SELECTED RESULTS...

Prevalence

- The percentage of adult Iowans who are current smokers is now 18%. (Smoking prevalence was 23% in 2002.)
- For young adults ages 18 -24, the percentage of smokers is 34%, almost twice the rate of older adults.
- Iowans who live in a household at or below the federal poverty level are 2½ times more likely to smoke than adults with higher incomes (44% vs. 17% respectively).

Cessation

- More than 72% of current smokers report that they would like to quit.
- About 43% of smokers made a serious quit attempt (stopped smoking for one day or more) during the past year.
- Among those smokers who tried to quit during the past 12 months, 33% used the nicotine patch, nicotine gum, or some other medication to help them quit.

Secondhand Smoke

- Among current smokers, 48% had one or more children living in their household.
- Among adults, 95% believe that breathing someone else's smoke is harmful to health.
- The vast majority of adult Iowans, 90%, agree that people should be protected from exposure to secondhand smoke.

For more information, see www.idph.state.ia.us/tobacco/common/pdf/ATS_2006_Final_Draft.pdf.

Substance Abuse Treatment

Substance abuse treatment is provided to all 99 counties in Iowa using funding from the Alcohol and Drug Abuse and Mental Health Services block grant, state substance abuse appropriations, and Medicaid. Iowa operates under a managed care system which is currently administered by Magellan Behavioral Care of Iowa (MBCI). MBCI contracts with a total of 64 service providers in 22 service areas as represented on the map on the next page. The 64 service providers include 32 who receive funding from both IDPH and Medicaid, and 32 who are funded through Medicaid only. Services are available to all Iowans regardless of their ability to pay or financial status through a sliding-fee schedule.

The reporting period was for calendar years 1998-2006. The numbers reflect those identifying a county of residence in Iowa. Those identifying their residence outside of Iowa were not counted. The count is unduplicated with the following exceptions: a client was counted twice if the primary substance of abuse changed between admissions or if the client's age changed between admissions.

STATE OF IOWA ADMISSIONS TOTALS FOR SUBSTANCE ABUSE TREATMENT...

Prenatal and Infant Health

Each year families across the United States bring home a healthy baby who has all the potential for a full and productive life. However, some families will suffer the loss of their child soon after birth.

Infant morbidity and mortality are critical indicators of the health of a population. Low birth weight and preterm birth result in a significant loss of life; surviving infants often sustain residual injuries that affect quality of life, and there is substantial financial cost to individuals and to society in caring for these children.

Certain factors have proven to increase the likelihood of delivering a low birth weight or preterm infant, such as (1) multiple births; (2) cigarette smoking during pregnancy; (3) substance abuse immediately prior to conception and during pregnancy (including alcohol abuse); (4) maternal age extremes; and (5) short inter-pregnancy interval.

Birth defects rank as the leading cause of mortality in full-term newborn babies in the United States. Iowa's overall birth defect rate is approximately 4.6% of all births. The state of Iowa has taken a leadership role in birth defect surveillance and serves as a model to other states. Iowa has also partnered with the March of Dimes' Folic Acid education campaign and the Preterm Birth Prevention campaign. Adequate folic acid intake by women of reproductive years has been demonstrated to decrease the risk of neural tube defects in children. Early prenatal care for mothers and health education to women and medical providers allow for a healthier pregnancy and improved birth outcomes.

Interventions need to focus on providing preconceptional health care to women, early and comprehensive prenatal care, and family support that includes promotion of healthy lifestyles.

IN AN AVERAGE WEEK IN IOWA¹

- ✓ 739 babies are born.
- ✓ 62 babies are born to teen mothers.
- ✓ 50 babies are born to mothers who receive inadequate prenatal care.
- ✓ 52 babies are born with low birth weight.
- ✓ 87 babies are born preterm.
- ✓ 4 babies die before their first birthday.

Infectious Diseases

Fifty-one specific infectious diseases are listed as reportable conditions in the Iowa Administrative Code 641, Chapter 1, although many other diseases are reportable as rare or unusual diseases. Disease surveillance, consulting, and outbreak management are provided by the Center for Acute Disease Epidemiology. The Bureau of Prevention and Immunization provided education programs and vaccine distribution services. Local public health nurses or

HIGHLIGHTS...

- ✓ IDPH received 1963 disease reports of cases of Mumps in 2006.
- ✓ IDPH received 1106 disease reports of cases of Pertussis in 2005.
- ✓ IDPH followed-up on 475 cases of Salmonella in 2006

disease prevention specialists, in conjunction with the staff epidemiologists at the Iowa Department of Public Health, interview persons with selected conditions or diseases and conduct investigations of disease outbreaks. Disease prevention steps include promoting vaccinations, partner counseling/referral services for sexually transmitted diseases, and disease

education initiatives.

Increases in reported cases of certain infectious diseases are often the result of specific outbreak situations:

- Increases in Hepatitis A cases reported from 1996–1998 were due to outbreaks in Woodbury (1996) and Polk (1997-1998) counties and were related to transmission among methamphetamine users.
- An imported case of measles occurred in 2004 in an Iowa resident returning from India. Two additional cases of measles were traced back to the imported case.
- Iowa experienced large outbreaks of pertussis and mumps cases statewide during the 2004-2006 timeframe.
- The outbreak of rubella in 1999 originated in a Hispanic migrant worker population. Immunization clinics were held in a number of packing plants across the state to contain the outbreak.

Infectious diseases continue to be a concern, and IDPH is working daily to control local outbreaks.

Cancer Incidence and Mortality

Cancer is the second leading cause of death in Iowa. From 1996 through 2004, 57,735 Iowans died from cancer and 139,326 invasive cancers were newly diagnosed. During this period, cancer accounted for 23% of deaths in Iowa. Although it occurs in people of all ages, more than 80 percent of new cancers are diagnosed in those 55 years of age and older.

For all cancer incidence and mortality, the age-adjusted rates by county grouping increased slightly as the average population increased between the three time periods spanning 1978 through 1995. For the 1996-2004 period, these rates show little difference. The crude rates, however, show the opposite trend, as these rates were highest in counties with average populations < 10,000. This reflects a larger proportion of older people in the smaller, more rural counties (see tables and graph in Demographics). Since the 1990s, the

Leukemia
Brain and other central nervous system
Lymphomas

U.S. and Iowa have experienced a decline in age-adjusted cancer mortality rates. Today, less than half of Iowans newly diagnosed with a cancer will die from it. Survival rates, however, vary considerably by cancer site. As the survival rate decreases, the number of cancer deaths gets closer to the number of newly diagnosed cancers.

Tobacco use is the leading modifiable risk factor for cancer, and is associated with cancers of the lung, oral cavity (excluding lip),

esophagus, larynx, pancreas, stomach, uterine cervix, urinary bladder, and kidney. Alcohol consumption is also a known risk factor for cancers of the oral cavity (excluding lip), esophagus, and larynx. Ongoing research indicates that dietary factors may play an important role in the occurrence of cancers of the prostate and colorectum. Other important risk factors include obesity for cancer of the uterine corpus, excessive sunlight exposure for skin melanoma, and genetic predisposition (or positive family history) for colorectal, prostate, and breast cancers.

The State Health Registry of Iowa has been recording the occurrence of cancer in Iowa since 1973. It receives mortality data from the Iowa Department of Public Health (IDPH). The Registry's incidence and IDPH's mortality databases have been used to generate the cancer incidence and cancer mortality statistics provided in this section of the 2007 Iowa Health Fact Book via a software program called SEER*Stat, which is provided by the National Cancer Institute.

Cervical Cancer Mortality by County Group 1978-2004

[This page has been intentionally left blank.]

Injury Mortality

Transportation-related mortality accounted for 4,371 deaths in Iowa from 1996 to 2004, 91% of which were motor vehicle fatalities. The rates for these fatalities are highest in the rural counties and lowest in the most urban counties. Rates for suicide and firearm mortality are also highest in the most rural counties. Falls mortality tends to be highest in rural counties, but the age-adjusted rates are more similar for the county groups. Homicide rates are consistently higher in the urban counties. Poisoning mortality rates have shown variation across years for each county group. The state's mortality rate from burns has decreased since 1979. In general, drowning deaths have consistently decreased across all county levels since 1979. Deaths from all other unintentional injuries are difficult to compare for 1999-2004 and preceding years due to changes in the mortality classification systems (discussed below).

HIGHLIGHTS...

- ✓ Injuries are the leading cause of death in persons 1-34 years of age.
- ✓ Motor vehicle deaths account for 91% of all transportation deaths in Iowa.
- ✓ Crude mortality rates from motor vehicle accidents, suicide, firearms, and falls are highest in rural counties.

Beginning in 1999, the tenth revision of the International Classification of Diseases (ICD-10) replaced the ninth version (ICD-9) as the standard mortality classification system. ICD-10 is more detailed than ICD-9; ICD-10 has about 8,000 categories while ICD-9 has about 5,000 categories. Also, some of the coding rules and rules for selecting the underlying cause of death have changed. Because of the new classification system, observed changes in mortality rates between 1999 and 2004 and preceding years could be due, in part, to changes in the method of mortality classification. Therefore, one should compare rates from 1999-2004 and preceding years with caution. The ICD-9 and ICD-10 codes used for each type of Injury Mortality are listed in Appendix III.

The source of this mortality data is the cause of death data obtained from death certificates filed at the Iowa Department of Public Health. Analysis was done by the State Health Registry of Iowa and the Center for Public Health Statistics at the University of Iowa. Age-adjusted rates were calculated using the Year 2000 U.S. population distribution.

[This page has been intentionally left blank.]

Youth Injury Mortality

Injuries remain the leading cause of death in persons age 1-34 years and contribute the most to years of life lost (YLL), particularly for those events of pre-adult ages. Deaths from unintentional injuries, homicides, and suicides are important public health problems in those 15-24 years of age and many of these deaths are preventable.

Transportation fatalities accounted for 277 deaths for youth aged 0-14 from 1996-2004. Of these, 87% were due to motor vehicle traffic death. In the 15-19 age range, 570 transportation deaths occurred over this same period with 96% accounted for by motor vehicle traffic deaths. In general, transportation mortality rates are higher in the more rural counties for both age groups. For 15-19 year-olds during 1996 through 2004, the mortality rate in the most rural of counties was double that of the state. Tables other than transportation are not presented due to the small number of events in both age ranges.

HIGHLIGHTS...

- ✓ Unintentional injuries, homicides, and suicides are important public health problems in those 15-24 years of age.
- ✓ Injuries contribute the most to years of life lost (YLL).
- ✓ Motor vehicle deaths accounted for 96% of all transportation deaths in youth aged 15-19 in Iowa.

The cause of death data are obtained from death certificates filed at the Iowa Department of Public Health. Analysis was done by the State Health Registry of Iowa at the University of Iowa. Crude and age-adjusted rates for ages 15-19 are identical to one another because only one age group in the age-adjustment analysis is represented. The crude and age-adjusted rates for the 0-14 age group show only slight differences as this represents four age groups (< 1, 1-4, 5-9, and 10-14) in the age-adjustment analysis. We therefore display only crude rates in the tables and graphs.

Other Mortality

With the population aging, chronic disease has become a major determinant of the health of Iowans and the need for health care services in the state.

Heart disease, still the number one cause of death in Iowa, accounted for 290 deaths per 100,000 persons (crude rate) between 1996 and 2004. Using age-adjusted rates, the four county groupings (based on county size) do not vary much, but we do see a consistent decline over time. In the 1978 to 1983 period, the state age-adjusted mortality rate was 365 per 100,000, whereas it has dropped steadily to 231 per 100,000 by the 1996-2004 time period. This represents a 37% decline.

Stroke is currently the third leading cause of death in Iowa, with a crude mortality rate of 75 per 100,000 between 1996 and 2004. From 1978 through 1990, we experienced a steady decline in age-adjusted stroke mortality, but it declined only slightly between 1990-1995 and 1996-2004. The age-adjusted mortality rates for chronic

MAJOR CAUSES OF DEATH IN IOWA...

- ✓ Heart disease
- ✓ Cancer
- ✓ Stroke
- ✓ Chronic obstructive pulmonary disease
- ✓ Unintentional injuries (including MVC)
- ✓ Pneumonia/influenza
- ✓ Diabetes
- ✓ Alzheimer's disease
- ✓ Infectious/parasitic diseases
- ✓ Suicide

obstructive pulmonary disease, currently the fourth leading cause of death, have been increasing across time with the larger counties experiencing the highest rates. The fifth leading cause, unintentional injuries, includes motor vehicle collisions (MVC). Death from pneumonia and influenza, the sixth leading cause of death, shows little overall change over time, when adjusted for age, but crude rates indicate a greater problem in the smaller counties, due to their larger proportion of elderly. The smaller counties are also exhibiting a greater problem with mortality due to diabetes, kidney diseases (nephritis, nephritic syndrome, and nephrosis), and Alzheimer's disease, based upon crude mortality rates, which when compared to the age-adjusted rates indicate this is primarily due to their larger proportion of elderly.

These data were obtained from death certificates filed at the Iowa Department of Public Health via the National Center for Health Statistics and the SEER*Stat software program provided by the National Cancer Institute.

Health Care Providers

The Office of Statewide Clinical Education Programs (OSCEP) at the University of Iowa Carver College of Medicine, the Iowa Department of Public Health, Board of Nursing, and the Bureau of Emergency Medical Services collect the health care provider data presented in this Iowa Health Fact Book.

OSCEP provides an up-to-date inventory of physicians, physician assistants, advanced registered nurse practitioners, pharmacists, and dentists, which facilitates tracking trends in Iowa health professionals and provides feedback to the health science colleges on the progress of their programs.

The Board of Nursing enforces and regulates nursing education, nursing practice, and continuing education for nurses. It sets standards, provides evaluation and licensing, and investigates complaints about licensed practical nurses, registered nurses, and advanced registered nurse practitioners. Its mission is “to protect the public health, safety and welfare of Iowans by ensuring that nursing is practiced by competent licensed individuals within their practice field.” Data related to the nursing supply are housed within the Board of Nursing.

The Bureau of Emergency Medical Services (EMS) is a regulatory agency that establishes initial training, continuing education, and renewal requirements leading to certification of emergency medical care providers, including those presented here. The EMS Bureau is also responsible for the authorization and regulation of EMS service programs (levels First Responder through Paramedic), and a statewide trauma system. In addition, the Bureau has statewide programs dealing with system development initiatives, injury prevention, and emergency medical services for children.

Seventeen other licensing boards are housed at the Iowa Department of Public Health, which collect data about practice, licensing/certification, and other supply information.

A map of Iowa divided into its 99 counties. Each county is labeled with its name and the number of COVID-19 cases. The counties are shaded in different colors based on the case count: light blue for low counts (e.g., Lyon, Osceola), medium blue for moderate counts (e.g., Polk, Johnson), dark blue for higher counts (e.g., Dubuque, Scott), and grey for very low or zero counts (e.g., Allamakee, Clayton). The map shows a general trend of increasing case counts from north to south and west to east.

Health Care Facilities

The information presented on health care facilities comes from the Division of Health Facilities in the Iowa Department of Inspections and Appeals (DIA). This state agency is responsible for inspection of all Chapter 135C licensed health care facilities in Iowa, including those presented in the 2007 Iowa Health Fact Book. Under state law the DIA is responsible for the inspection and licensure of Hospitals (135B), Birth Centers (135G), Hospices (135J) and Psychiatric Medical Institutes for Children (135H). This agency also conducts inspections of various Medicare/Medicaid entities (e.g., skilled nursing facilities, home health agencies, hospices, hospitals, CLIA labs, etc.) through contract with the Health Care Financing Administration (HCFA), and investigates complaints of substandard care or services in these entities. Additional information may be accessed through their web site: www.dia-hfd.state.ia.us.

There is only one Intermediate Care Facility for Persons with Mental Illness in Iowa (a 25-bed unit in Davis County), so statewide data for this type of facility are not presented.

FACILITY TYPES REGULATED BY THE STATE OF IOWA DIVISION OF HEALTH FACILITIES...

- Ambulatory Surgical Centers
- Birth Centers
- Chronic Confusion or Dementing Illness Units
- Community Mental Health Centers
- Comprehensive Out-Patient Rehabilitation Facilities
- Critical Access Hospitals
- End-Stage Renal Disease Facilities
- Home Health Agencies
- Hospices
- Hospital Based (Distinct-Part) Nursing Facility Units
(Covered by Medicaid)
- Hospital Based (Distinct-Part) Skilled Nursing Facility Units
(Covered by Medicaid)
- Hospital Based (Distinct-Part) Skilled Nursing
Facility/Nursing Facility Units (Covered by Medicaid)
- Hospital Based Intermediate Care Facilities for the
Mentally Retarded (Covered by Medicaid)
- Hospitals
- Hospitals with Psychiatric Units excluded under the
Medicare Prospective Payment System
- Hospitals with Swing-Beds
- Intermediate Care Facilities for Persons with Mental Illness
- Intermediate Care Facilities for the Mentally Retarded
- Laboratories Covered under the (Federal) Clinical
Laboratories Improvement Amendments 1988 (CLIA
'88)
- Nursing Facilities
- Organ Procurement Organizations
- Portable X-Ray Service Suppliers
- Psychiatric Medical Institutions for Children
- Rehabilitation Agencies with Out-Patient Physical
Therapy/Out-Patient speech Pathology/Out-Patient
Occupational Therapy Providers
- Residential Care Facilities
- Residential Care Facilities for Persons with Mental Illness
- Residential Care Facilities for the Mentally Retarded
- Rural Health Clinics
- Specialized 3-5 Bed Facilities

Community and Migrant Health Centers

Community and migrant health centers provide affordable, accessible, and acceptable primary health care to Iowans. These centers primarily serve indigent, medically-underserved, and under-insured populations and assist special populations through grants and programs.

Community and migrant health centers are the safety net providers. They provide several health services to the community, including comprehensive health services with a variety of physician specialties, general dentistry and community health programs involving oral health education and dental screening, prenatal care, family planning, health screenings, immunizations, case management, and pharmacies. Centers may be affiliated with a regional health system that can provide access to substantial support systems.

Community Health Centers are funded by Section 330 funds of the Public Health Service Act. Iowa has eight such centers (plus the Des Moines Health Center, which provides similar services). They are required to provide primary health services, dental services, mental health services, prevention, education, and case management. Patients cannot be turned away on the basis of ability to pay. A sliding fee scale based on income is mandated. The C/MHC model is a non-profit corporation whose board members must be members of the community and at least one percent of the board must be patients of the health center. Further information on Community Health Centers can be obtained from the Iowa/Nebraska Primary Care Association (IA/NEPCA) at the web site www.ianepca.com.

Certified Rural Health Clinics

A rural health clinic is a clinic located in a rural area designated as a shortage area for personal health service and/or primary medical care manpower. In June of 2007, there were a total of 148 certified rural health clinics in Iowa (Iowa Department of Inspections and Appeals), located in 58 of our 99 counties. Such a clinic is neither a rehabilitation agency nor a facility primarily for the care and treatment of mental diseases. Patient services are furnished by a physician's assistant or nurse practitioner at least 50 percent of the time the clinic operates. The definition of such is found in Title 42 in the Code of Federal Regulations. Rural Health Clinics receive enhanced reimbursement for Medicare.

Environmental Health Indicators

Whether we consider global warming or water quality, it is clear that our environment affects us both directly and indirectly. While some environmental health issues have existed since the beginning of the human race, most have become evident in the last few centuries. These problems have emerged as a result of our growing and changing population. The industrial revolution has created air and water pollution problems as well as overcrowding and sanitation issues. As of June 2007, over 6.6 billion people inhabited the earth.

The environment plays a role in many health issues previously discussed including birth defects, cancer, respiratory diseases, and many infectious diseases. Other concerns include allergies, fertility, and exposure to animal and insect vectors. In Iowa, public health officials are especially concerned with the quality of their drinking water, recreational waters, indoor and outdoor air quality, lead poisoning, safe housing, and hazardous and solid waste.

As we attempt to provide food, water, and shelter for the world's population, we must remain aware of how our actions affect our local and global environment. At the same time, we must monitor and attempt to prevent any adverse health conditions that are caused by interactions with the environment.

ISSUES IN IOWA...

- ✓ Drinking water quality
- ✓ Recreational water quality
- ✓ Indoor and outdoor air quality
- ✓ Lead poisoning
- ✓ Safe housing
- ✓ Hazardous and solid waste

Childhood Blood Lead Poisoning

Childhood lead poisoning has significant effects on the health of children and on community health. Lead has adverse effects on nearly all organ systems in the body. It is especially harmful to the developing brains and nervous systems of children under the age of six years. At very high blood lead levels, children can suffer severe brain damage or even die. At blood lead levels as low as 10 micrograms per deciliter ($\mu\text{g/dL}$), a child's intelligence, hearing, and growth are affected. In a community, the presence of lead-poisoned children can be associated with an increase in the number of children with developmental deficits and learning disorders. This places an unnecessary and expensive burden on the educational system. The presence of lead-poisoned children also requires substantial community public health resources for medical and environmental case management services.

High blood lead levels have adverse effects on nearly all organ systems in the body, and are especially harmful to children.

Most cases of childhood lead poisoning are caused by lead-based paint, which is found in most homes built before 1960. Young children who live in pre-1960 homes become lead-poisoned when they put paint chips or exterior soil in their mouths or when they get house dust and soil on their hands and put their hands in their mouths.

Although lead poisoning can cause serious health problems – including death – most lead-poisoned children demonstrate no visible symptoms. This makes it much more important to have an effective program to prevent childhood lead poisoning.

Most cases of childhood lead poisoning are caused by lead-based paints found in homes built before 1960.

Since 1992, the Iowa Department of Public Health (IDPH) has recommended that all children in Iowa under the age of six years be tested for lead poisoning. In addition, state and federal laws require that all children under the age of six and covered by Medicaid be tested for lead poisoning. In spite of this, the statewide testing rates among children covered by Medicaid and children who are not covered by Medicaid are virtually identical. On April 17, 2007, Governor Culver signed legislation requiring all Iowa children to receive a blood lead test before the age of mandatory school attendance.

In Iowa, blood lead testing is conducted by the Title V Child's Health Program, local health departments, and by many private physicians. The IDPH childhood blood lead level surveillance system tracks all testing in the state. Thus, blood lead testing results collected as required by Medicaid, as well as those collected from voluntary testing of non-Medicaid children are reported to IDPH.

In the following tables, data are presented for children who were born in calendar year 1999 and 2000 and who received at least one blood lead test before their sixth birthday. Children followed for blood lead poisoning may be tested multiple times. The test results that are presented in the following tables reflect the highest blood lead level for any particular child.

For each county, the number of children receiving a blood lead test who were identified with blood levels greater than or equal to 10 micrograms per deciliter ($\mu\text{g}/\text{dL}$). A blood level of 10 $\mu\text{g}/\text{dL}$ has been identified by the Centers for Disease Control and Prevention as the threshold for lead poisoning in children and is categorized as "high" for the graphs. Additional data, such as the percent of children in each birth cohort who were tested for lead poisoning, are also presented.

For Iowa children born in 1999-2000, 64 percent were tested for lead poisoning, and 6.7 percent of these children had blood lead levels greater than or equal to 10 $\mu\text{g}/\text{dL}$.

Of the children born in Iowa in 1999, 61.5 percent received at least one blood test before their sixth birthday (range by county: 23.6 to 100 percent), and 6.9 percent of these children had blood levels greater than or equal to 10 $\mu\text{g}/\text{dL}$ (range by county: 0.0 to 22.6 percent). Of the children born in Iowa in 2000, 66.5 percent received at least one blood test before their sixth birthday (range by county: 23.3 to 100 percent), and 6.6 percent of these children had blood levels greater than or equal to 10 $\mu\text{g}/\text{dL}$ (range by county: 0.0 to 20 percent).

--------------------------	--

Appendix II: Glossary of Terms

Glossary of Terms

Age-Adjusted Rate (Direct Method): A weighted average of the age-specific incidence or mortality rates from the targeted population(s) where the weights are the proportions of persons in the corresponding age groups of a standard population. In this document, the Year 2000 U.S. population is used as the standard population. Calculating an age-adjusted rate allows for comparisons across targeted populations after accounting or “adjusting” for possible differences in the age-distribution of these populations.

Area Trauma Care Facility: Provides initial evaluation and stabilization, including surgical intervention for the severely injured patient. An area trauma care facility provides comprehensive inpatient services to patients who can be maintained in a stable or improving condition without specialized care. Critically injured patients who require specialized care are transferred to a resource or regional trauma care facility. An organized trauma team including a general surgeon, emergency physician, CRNA and/or anesthesiologist, nursing and ancillary personnel are promptly available to meet the patient upon arrival at the emergency department. The general surgeon, emergency physician, and ancillary personnel may be on-call from outside the hospital but with a clear commitment to meet a patient upon arrival at the emergency department when give timely notice by out-of-hospital EMS providers. Some area trauma care facilities elect to provide in-house 24-hour emergency physician coverage. In addition to direct patient care, area trauma care facilities provide community and outreach education and injury prevention programs.

Chronic Confusion or Dementing Illness Units: “Chronic Confusion or Dementing Illness” is a special license classification for nursing facilities or a special unit within such a facility providing care to persons who suffer from chronic confusion or dementing illness. Reference to Chronic Confusion of Dementing Illness Units is made in the acts and joint resolutions of the 1990 regular session of the Seventy-Third General Assembly of the State of Iowa.

Community Trauma Care Facility: Provides initial evaluation and stabilization of the severely injured patient. Stabilization may include surgical intervention. Most patients needing surgical intervention and/or specialty care are transferred to resource or regional trauma care facilities. Community trauma care facilities have the necessary equipment and diagnostic resources to resuscitate the severely injured patient. An organized team including a physician, nursing and ancillary personnel are promptly available to meet the patient upon arrival at the emergency department if given timely notice by out-of-hospital EMS providers. In addition to patient care, a community trauma care facility provides continuing education and injury prevention programs.

Crude Rate: The number of events or occurrences of disease in a given time period divided by the population at risk for that event or disease over the same time period.

Emergency Medical Technician – Basic: The EMT-B course emphasizes the development of student skills in patient assessment and examination; the recognition of signs and symptoms of illness or injury; proper procedures when rendering emergency medical care including patient assisted medications, automated external defibrillation, maintenance of a non-medicated IV, and the use of an advanced airway device. General topics covered include: human anatomy and physiology, bleeding and shock, bandaging and splinting, medical/behavior emergencies, obstetrics/gynecology, extrication from automobiles, farm, industrial and environmental emergencies, and ambulance operations.

Emergency Medical Technician – Intermediate: The EMT-I course involves additional training in patient assessment, intravenous therapy, advanced airway management techniques and automated defibrillation.

Emergency Medical Technician – Paramedic: This level covers additional emergency medical care skills including cardiac evaluation and treatment, medication effects and treatment, and advanced airway management techniques.

Emergency Medical Technician – Paramedic Specialist: This level identifies individuals who have successfully completed a program of training that used, as a minimum, the 1985 EMT-P national standard curriculum (NSC), plus documentation of completion of the objectives to the 1998 EMT-P NSC, or completed the 1998 EMT-P NSC and have successfully completed the department's testing requirements.

Fetal Death: A birth that fails to show any sign of life after delivery. Reportable fetal deaths in Iowa are those greater than 20 weeks gestation. The responsibility for determining if a birth meets this definition is that of the attending physician. "Fetal death" and "stillbirth" are synonymous terms.

First Responder: The First Responder is trained in patient stabilizing techniques and basic emergency medical care prior to the arrival of an ambulance. Skills in this program include patient assessment, vital signs, automated external defibrillation, oxygen delivery, and use of an advanced airway device.

Hospital: Any place which is devoted primarily to the maintenance of facilities for the diagnosis, treatment, or care of two or more non-related individuals suffering from illness, injury, or deformity for a period exceeding 24 hours. It is also a place which is devoted primarily to the rendering of obstetrical or other medical/nursing care for two or more non-related individuals for a period exceeding 24 hours. It can be any institution, place, building or agency in which any accommodation is primarily maintained, furnished or offered for the care of two or more non-related aged or infirmed person requiring or receiving chronic or convalescent care for a period exceeding 24 hours. Hospitals shall include sanitariums or other related institutions within the meaning of the federal Hill-Burton Act. A hospital shall include, in any event, any facilities wholly or partially constructed, or constructed with federal assistance pursuant to Public Law 725, 79th Congress, approved August 13, 1946. Definition is found in Title 42 in the Code of Federal Regulations and 135J of the Iowa Administrative Code.

Infant Death: Death of a liveborn infant under one year of age. This includes both neonatal and postneonatal deaths.

Intermediate Care Facilities for the Mentally Retarded: Institutions or distinct parts of institutions whose primary purpose is to provide health or rehabilitative services to three or more individuals who primarily have mental retardation or a related condition. Intermediate Care Facilities for the Mentally Retarded must meet the requirements of Iowa Code Chapter 135C and federal standards codified in 42 United States Code 1936d, which is contained in Title 42 of the Code of Federal Regulations, Part 483, Subpart D, 410-480. Definition is found in Chapter 135C of the Code of Iowa.

Intermediate Care Facilities for Persons with Mental Illness: Institutions, places, buildings or agencies whose primary purpose is to provide accommodation, board and nursing care for a period exceeding 24 consecutive hours to three or more individuals who primarily have mental illness. Definition is found in Chapter 135C of the Code of Iowa.

Live Birth: A birth that shows any sign of life after delivery. The World Health Organization considers a sign of life as being the breathing or showing of any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached. The responsibility for determining if a birth meets this definition is that of the attending physician.

Metropolitan Statistical Area (MSA): An area with one city of 50,000 or more inhabitants or a Census defined urbanized area and a total metropolitan population of at least 100,000 (75,000 in New England).

Neonatal Death: Death of a liveborn infant occurring within the first 27 days of life.

Nursing Facilities: Institutions or distinct parts of institutions housing three or more individuals for a period exceeding 24 consecutive hours, whose primary purpose is to provide health-related care and services, including rehabilitation, for individuals who because of mental or physical condition, require nursing care and other services in addition to room and board. Nursing facilities do not engage primarily in providing treatment or care for mental illness or mental retardation. Definition is found in Chapter 135C of the Code of Iowa.

Perinatal Death: Death of a fetus of greater than 20 weeks gestation or death of a liveborn infant under 28 days of life.

Primary Care Physicians: Includes Family Practice, Internal Medicine, Pediatric, and Obstetrics/Gynecology physicians.

Public Access Defibrillation: An EMS provider level for nontraditional providers of emergency medical care who have successfully completed a program that uses a curriculum that meets the approved Iowa objectives regarding Public Access Defibrillation and have successfully completed the department's testing requirements.

Residential Care Facilities: Institutions, places, buildings, or agencies providing accommodation, board, personal assistance and other essential daily living activities for a period exceeding 24 consecutive hours. Individuals living in a residential care facility are unable to sufficiently or properly care for themselves because of illness, disease, or physical or mental infirmity, but do not require the services of a registered or licensed practical nurse, except for emergencies. Definition is found in Chapter 135C of the Code of Iowa.

Residential Care and Specialized 3-5 Bed Facilities for the Mentally Retarded: Facilities that provide accommodations, board, personal assistance, essential activities of daily living and habilitation services to three or more individuals with mental retardation. Residents of a Residential Care Facility for the Mentally Retarded are unable to sufficiently or properly care for themselves, but do not require the services of a registered or licensed practical nurse. The specialized license is for Residential Care Facilities which serve persons with mental retardation, chronic mental illness and other developmental disabilities having five or fewer residents as specified in Iowa Code Section 225C.26. The facility is exempt from Iowa Code Section 135.63. Definition is found in Chapter 135C of the Code of Iowa.

Regional Trauma Care Facility: Provides comprehensive care for the severely injured patient with complex multisystem trauma. An organized trauma team including a general surgeon, emergency physician, anesthesiologist, nursing and ancillary personnel are immediately available to the patient upon arrival at the emergency department. The general surgeon and anesthesiologist are immediately available to the patient upon arrival at the emergency department. The general surgeon and anesthesiologist may take call from outside the hospital, but with a clear commitment to meet the patient upon arrival at the emergency department. A broad range of physician specialists are on-call and promptly available to provide care and/or consultation. In addition to direct patient care, regional trauma care facilities are responsible for community and outreach education and injury prevention.

Resource Trauma Care Facility: Provides the most comprehensive care for the severely injured patient with complex multisystem trauma. An organized trauma team including a general surgeon, emergency physician, anesthesiologist, nursing and ancillary personnel are immediately available to the patient upon arrival at the emergency department. Physician specialists may also respond immediately with the trauma team. A broad range of physician specialists are on-call and promptly available to provide care and/or consultation. In addition to direct patient care, resource trauma care facilities are responsible for resident training, research, community and outreach education and injury prevention.
